

Bulged methane chamber, 2.5 kg rod (106 m³), to scale

where the solved blast loads the wall hardest (0.25 cm cells)

The steady peak, about 94 bar, is the same everywhere.
Only the microsecond spike varies along the wall.

The 5 kg chamber is this shape grown by $2^{(1/3)}$ in every length: 212 m³, 7.6 m across, the same pressures.

wall, gas side at left (not to scale)
